CopperHead™ S-9210 Laser Screed®

The World's First Walk-Behind Laser Screed

CONVENTIONAL VS COPPERHEAD™

Screeding the conventional wet-pad method is an extremely labor intensive process. The process is strenuous, making it difficult to maintain constant levels of quality and productivity.

The CopperHead S-9210, the world's first walk-behind laser screed, is the solution to this problem. The process is automated. Two laborers and one CopperHead operator screed to laser tolerances without 'wet rails' or pipe screeds. No bent-over screeding, and grade control is continuous, automatic, and precise.

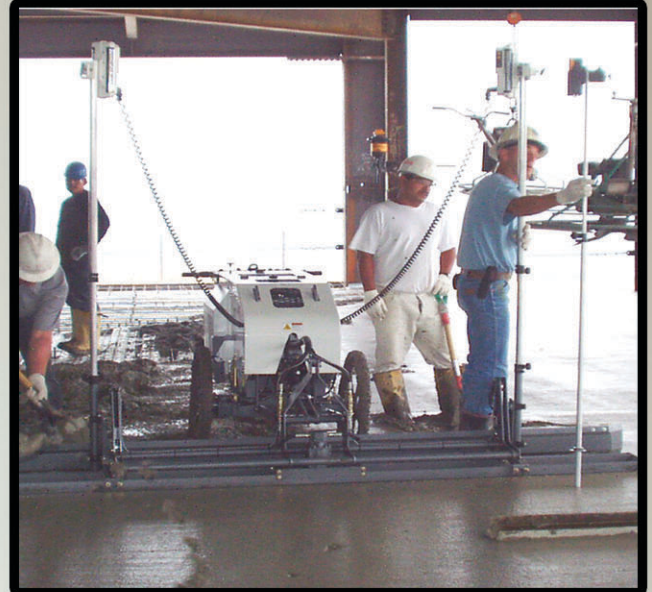

LASER ACCURACY

You get precise flatness and levelness with every CopperHead. You can now routinely produce floors that are flatter and more level than floors produced with any conventional method.

EASY TO OPERATE

Setting grade is easy, a few minutes at the start of the pour and you are ready to go. This laser screed is so compact, portable, and extremely maneuverable, you can gain access to almost any area. It can be used on grade and on upper deck projects.

BENEFITS

- Faster screeding due to elimination of wet-pads
- Flatter strike-off due to continuous laser control
- Fewer man-hours due to less manual effort
