HoseHog

SOMERO® **ENTERPRISES, INC.**

Somero's HoseHog™ was The Experts' Choice as the Most Innovative Product in Placement Tools and Equipment at the 2007 World of Concrete show.

The HoseHog is a unique combination of advanced technology and old-fashioned horsepower that removes the back-breaking and extremely labor-intensive task of dragging concrete hose on elevated deck or slab on grade.

The HoseHog is a 13 HP device that can lift a 3-, 4- or 5-inch hose or slick line filled with concrete, and move it easily during concrete placement on decks where a pump mast can't reach. The axles are designed such that the wheels can turn perpendicular to the hose, allowing the assembly to be moved easily in any direction. A pan beneath the joints in the slick line allows it to skid on concrete without damaging the surface.

This innovative tool allows you to place concrete faster, reduce back injuries and keep your crew fresh. With a larger diameter hose, you no longer have to trade off slower production for a healthy crew. The HoseHog offers the speed, control and power needed to pull hose, and has been proven to increase productivity by 20 percent to 30 percent.

Somero is once again using technology to increase productivity, improve jobsite safety and put dollars on your bottom line. The HoseHog works faster, delivers better results, reduces overall physical efforts, cuts crew costs, and reduces on-the-job injuries.

Founded in 1985, Somero Enterprises is a leading manufacturer of technologically advanced concrete finishing equipment and associated machinery. With manufacturing facilities in Michigan and corporate offices in New Hampshire, Somero has grown and prospered by delivering superior products to an international market.
